*Building an Emergency Plan* Nov 08 2021 Building an Emergency Plan provides a step-by-step guide that a cultural institution can follow to develop its own emergency preparedness and response strategy. This workbook is divided into three parts that address the three groups generally responsible for developing and implementing emergency procedures—institution directors, emergency preparedness managers, and departmental team leaders—and discuss the role each should play in devising and maintaining an effective emergency plan. Several chapters detail the practical aspects of communication, training, and forming teams to handle the safety of staff and visitors, collections, buildings, and records. Emergencies covered include natural events such as earthquakes or floods, as well as human-caused emergencies, such as fires that occur during renovation. Examples from the Barbados Museum and Historical Society, the Museo de Arte Popular Americano in Chile, the Mystic Seaport Museum in Connecticut, and the Seattle Art Museum show how

cultural institutions have prepared for emergencies relevant to their sites, collections, and regions.

*Airports and Unmanned Aircraft Systems* May 14 2022 The introduction of unmanned aircraft systems (UAS) has presented a wide range of new safety, economic, operational, regulatory, community, environmental, and infrastructure challenges to airports and the National Airspace System. These risks are further complicated by the dynamic and shifting nature of UAS technologies. The TRB Airport Cooperative Research Program's ACRP Research Report 212: Airports and Unmanned Aircraft Systems, Volume 1: Managing and Engaging Stakeholders on UAS in the Vicinity of Airports provides guidance for airport operators and managers to interact with UAS operations in the vicinity of airports. The demand for commercial UAS may increase significantly once advanced UAS operations—including beyond visual line of sight (BVLOS) operations, operations over people, and operations of multiple UAS by one pilot—are allowed through broader regulatory frameworks. Understanding the nature of UAS operations, platforms, and applications is a topic of interest at most, if not all, airports. Currently, federal regulations allow broad commercial use of UAS in the United States for the first time. However, UAS operations directly over people are still prohibited unless the operator has received a waiver or other approval from the Federal Aviation Administration (FAA). The activities of small UAS (those weighing less than 55 pounds) may take many forms, including multi-rotor, fixed wing, and hybrid vertical take-off and landing with fixed-wing forward flight vehicles. Some UAS operations near airports will require the ability to fly over populated areas and therefore will require waivers to allow operations over people. As a part of managing UAS operations, it will be important for airport operators to understand the regulatory requirements and framework as well as to have the ability to obtain waivers and exemptions. This guidebook describes the regulatory frameworks that currently exist so that airport managers and operators will be in a better position to interact and guide UAS users who fly in their vicinity. Other Resources: Volume 2: Incorporating UAS into Airport Infrastructure—Planning Guidebook provides planning, operational, and infrastructure guidance to safely integrate existing and anticipated UAS operations into an airport environment. Volume 3: Potential Use of UAS by Airport Operators provides airports with resources to appropriately integrate UAS missions as part of their standard operations. **Environmental Management Tool Kit for Obsolete Pesticides - Volume 5** Dec 17 2019 Within the remit of reducing world hunger FAO has been extensively involved with pests and pesticides management. Based on the experience gained over the past 20 years FAO has developed a series of tools which allow a risk based approach to dealing with obsolete pesticide stocks considering the potential impact on both public health and the wider environment. This has led to the development and publication of the Environmental Management Tool Kit Series. The methodologies presented in these tools have been developed to provide a sound technical baseline for implementation of pesticide inventory, obsolete stock site prioritization and safeguarding projects in developing and developed countries in many regions across the globe. They have a solid foundation in international regulations from the US and Europe and so can be considered as complying with international best practice for worker and environmental safety. Despite the implementation of projects resulting in the removal of the above ground stocks, pesticide legacy problems persist that affect the ground beneath the sites and the groundwater passing through it. In many cases the grounds at these sites present a greater risk to human health and the wider environment than the original pesticide stockpiles which are often sent for environmentally sound disposal. To assess the particular risks posed by pesticide contaminated land, FAO has developed a fifth tool in the EMTK series, the EMTK 5. The conclusions drawn from using EMTK5 enable the development of a national contaminated land risk management plan and site level risk reduction strategies which
