This book gives a comprehensive overview of HIV and AIDS including NeuroAIDS, as well as general concepts of pathology, immunity and immunopathology, diagnosis, treatment, epidemiology and etiology to current clinical recommendations in management of HIV/AIDS including NeuroAIDS, highlighting the ongoing issues, recent advances and future directions in diagnostic approaches and therapeutic strategies. Objective: The purpose of this pilot study was to assess the prevalence of oral manifestations among systemic lupus erythematosus (SLE) patients in Qatar, in order to warrant future studies that would investigate each one of these manifestations with detail and further scrutiny. Methods: Study procedures took place between November 2014 - April 2016. All patients visiting the outpatient rheumatology clinics at Hamad General Hospital, Doha, Qatar, were asked to join. The American College of Rheumatology (ACR) 1997 criteria of SLE was used. The patients were examined initially by a rheumatologist, and were later scheduled for an appointment with a dentist

at the same institution. A total of 77 patients were recruited for the study. Results: Prevalence rates for the different oral manifestations ranged from 2.4% for soft palate ulcers, cheilitis, and oral candida, to 88.1% for the presence of cavitations. Gingivitis, periodontal disease, cavities, and missing teeth were observed in more than 50% of the sample. The prevalence of periodontal disease and missing teeth was higher among those with an SLE duration >8 years. On the contrary, the prevalence of gingivitis and cavities was higher among those with an SLE duration ≤ 2648 years. Conclusion: This study found high rates of gingivitis, periodontal disease, cavities, and missing teeth among SLE patients in Qatar. It is recommended that health care providers of such patients monitor the presence of any oral manifestations in order to arrange for early treatment and prevention efforts. Future prospective longitudinal studies with adequate sample size and power are needed in order to ascertain any causation factors or common etiology pathways. Sexually transmitted diseases are notable for their fastidious requirements for transmission and growth and psychosocial morbidity. The combination of subtle or absent symptoms and stigma preventing the seeking of health care leaves many infections undiagnosed. Sexually transmitted diseases frequently affect the mucous membranes producing characteristic and potentially diagnostic lesions on the oral mucosa. The classic route of transmission and the corresponding clinical presentation of several of the sexually transmitted viruses, including herpes virus types I and II, Epstein Barr virus, Cytomegalovirus, Human Papilloma virus, Molluscum Contagiosum, as well as the Human Immunodeficiency Virus along with bacterial infections such as syphilis, gonorrhea, and the fungus candida are reviewed in this text book under the umbrella of STDs with potential oral involvement encountered in the sexually active patient. Part I features protozoal and helminthic diseases and Part II features bacterial and mycotic infections. (Author). AIDS is the abbreviation for acquired immune deficiency syndrome. The disease is caused by virus known as human immunodeficiency virus. Oral manifestations are the earliest and most important indicators of HIV infection. Oral lesions can not only indicate infection with HIV, they are also among the early clinical features of the infection and can predict progression of HIV disease to AIDS. Treatment of HIV patient involves trying to slow or stop the virus from spreading in the body's cells and treating or preventing disease that develop when a person's immune system has been damaged by the virus. Dental expertise is necessary for proper management of oral manifestations in HIV infection. Medical clinicians should be able to recognize HIV associated oral disease and to provide appropriate care and referral.
